

Task 1 Using the diagrams given in the presentation calculate how much (%) is the effect of applying different modifications (changing the gas, adding an extra pane, using a low emissivity coating) on the U value with respect to a benchmark case of double layer with air and no coating ? (keep the gap thickness to be 13 mm).

● Air $\Rightarrow \epsilon = 0.84$; $U_{\text{factor}} = 2,8 \text{ W/m}^2\cdot\text{K}$	100%
■ Argon $\Rightarrow \epsilon = 0.84$; $U_f = 2,65 \text{ W/m}^2\cdot\text{K}$	86,11%
▲ Krypton $\Rightarrow \epsilon = 0.84$; $U_f = 2,57 \text{ W/m}^2\cdot\text{K}$	77,77%

Changing the gas inside the panel, and considering a double layer window, we discover that:

U-factor decrease by 13,89 % with Argon and by 22,23 % using Krypton.

If we consider the same double layer window, whit an extra coat the result are:

● Air $\Rightarrow \epsilon = 0.1$; $U_{\text{factor}} = 1,81 \text{ W/m}^2\cdot\text{K}$	64.64%
■ Argon $\Rightarrow \epsilon = 0.1$; $U_f = 1,52 \text{ W/m}^2\cdot\text{K}$	54.28%
▲ Krypton $\Rightarrow \epsilon = 0.1$; $U_f = 1,43 \text{ W/m}^2\cdot\text{K}$	51.07%

Chianging the gas inside the panel, and considering a double layer window and using a low emissivity coating we discover that:

U-factor decrease by 35,36 % with Air, by 45,72% using Argon and by 48,93 % using Krypton.

● Air $\Rightarrow \epsilon = 0.84$; $U_{\text{factor}} = 1,8 \text{ W/m}^2\cdot\text{K}$	64,28%
■ Argon $\Rightarrow \epsilon = 0.84$; $U_f = 1,68 \text{ W/m}^2\cdot\text{K}$	60%
▲ Krypton $\Rightarrow \epsilon = 0.84$; $U_f = 1,59 \text{ W/m}^2\cdot\text{K}$	56,78%

Changing the gas inside the panel, and considering a tripl layer window, we discover that:

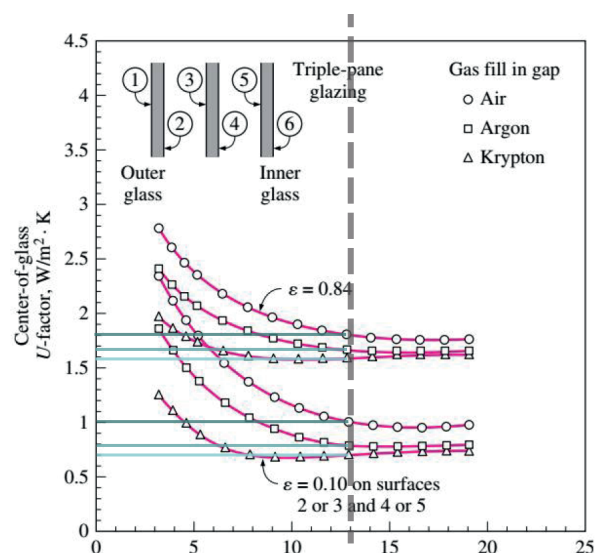

U-factor decrease by 35,72 % with air, by 40 % using Argon and by 43,22 % using Krypton.

If we consider the same double layer window, whit an extra coat the result are:

● Air $\Rightarrow \epsilon = 0.84$; $U_{\text{factor}} = 1 \text{ W/m}^2\cdot\text{K}$	35.71%
■ Argon $\Rightarrow \epsilon = 0.84$; $U_f = 0,79 \text{ W/m}^2\cdot\text{K}$	28.21%
▲ Krypton $\Rightarrow \epsilon = 0.84$; $U_f = 0,7 \text{ W/m}^2\cdot\text{K}$	25%

Chianging the gas inside the panel, and considering a double layer window and using a low emissivity coating we discover that:

U-factor decrease by 64,29 % with Air, by 71,79 % using Argon and by 75 % using Krypton.

Task 2. Consider the house that we analysed in the last two examples, calculate the heating and cooling load of the other windows which are fixed 14.4 m² on the west, fixed 3.6 m² on the south and an operable 3.6 m² on the south (the same window and frame type). How much does the total value change if I change the frame of the window from wooden one to aluminium ?

Heating case A (fixed 14,40 m² on the west)

From the class example: $\Delta T_{\text{heating}} = 24,8^{\circ}\text{C}$

$$U_{\text{windowwest}} = 2,84 \text{ W/m}^2 \cdot \text{K}$$

$$\begin{aligned} HF &= U_{\text{windowwest}} \times \Delta T_{\text{heating}} \\ &= 2,84 \text{ W/m}^2 \times 24,8^{\circ}\text{C} \\ &= 70,43 \text{ W/m}^2 \end{aligned}$$

$$\begin{aligned} Q_{\text{windowwest}} &= HF_{\text{windowwest}} \times A_{\text{windowwest}} \\ &= 70,43 \text{ W/m}^2 \times 14,40 \text{ m}^2 \\ &= 1014,19 \text{ W} \end{aligned}$$

Answer:

The heating value for the fixed window of 14,40m², on the west is 1014,19W

Heating case B (fixed 3,60 m² on the south)

$$\begin{aligned} Q_{\text{windowssouth}} &= HF_{\text{windowssouth}} \times A_{\text{windowssouth}} \\ &= 70,43 \text{ W/m}^2 \times 3,60 \text{ m}^2 \\ &= 253,54 \text{ W} \end{aligned}$$

Answer:

The heating value for the fixed window of 3,60m², on the west is 1014,19W

Heating case C (operable 3,60 m² on the south)

$$U_{\text{windowssouth}} = 2,87 \text{ W/m}^2 \cdot \text{K}$$

$$\begin{aligned} HF &= U_{\text{windowssouth}} \times \Delta T_{\text{heating}} \\ &= 2,87 \text{ W/m}^2 \times 24,8^{\circ}\text{C} \\ &= 71,17 \text{ W/m}^2 \end{aligned}$$

$$\begin{aligned} Q_{\text{windowssouth}} &= HF_{\text{windowssouth}} \times A_{\text{windowssouth}} \\ &= 71,17 \text{ W/m}^2 \times 3,60 \text{ m}^2 \\ &= 256,23 \text{ W} \end{aligned}$$

Answer:

The heating value for the fixed window of 3,60 m², on the west is 256,23W

Cooling case A (fixed 14,40 m on the west)

From the class example: $\Delta T_{\text{cooling}} = 7,9^{\circ}\text{C}$

$$U_{\text{windowwest}} = 2,84 \text{ W/m}^2 \cdot \text{K}$$

$$\begin{aligned} \text{HF} &= U_{\text{windowwest}} \times \Delta T_{\text{cooling}} \\ &= 2,84 \text{ W/m}^2 \times 7,9^{\circ}\text{C} \\ &= 22,43 \text{ W/m}^2 \end{aligned}$$

$$\begin{aligned} Q_{\text{windowwest}} &= \text{HF}_{\text{windowwest}} \times A_{\text{windowwest}} \\ &= 22,43 \text{ W/m}^2 \times 14,40 \text{ m}^2 \\ &= 322,99 \text{ W} \end{aligned}$$

$$\begin{aligned} \text{CF}_{\text{windowwest}} &= (U_{\text{windowwest}} \times (\Delta T - (0,46\text{DR}))) + (\text{PXi} \times \text{SHGC} \times \text{IAC} \times \text{FFs}) \\ &= 2,84 \text{ W/m}^2 \cdot \text{C} \times (7,9^{\circ}\text{C} - 0,46 \times 11,90^{\circ}\text{C}) \\ &= 2,84 \text{ W/m}^2 \cdot \text{C} \times (7,9^{\circ}\text{C} - 5,47^{\circ}\text{C}) \\ &= 2,84 \text{ W/m}^2 \cdot \text{C} \times 2,43^{\circ}\text{C} \\ &= 6,90 \text{ W/m}^2 \end{aligned}$$

$$\begin{aligned} (\text{PXi} \times \text{SHGC} \times \text{IAC} \times \text{FFs}) &= \\ &= 747 \times 0,54 \times 1 \times 0,56 = \\ &= 225,89 \text{ W/m}^2 \end{aligned}$$

$$\begin{aligned} \text{Total CF} &= 6,90 \text{ W/m}^2 + 225,89 \text{ W/m}^2 = \\ &= 232,79 \text{ W/m}^2 \end{aligned}$$

$$\begin{aligned} \text{TOTAL } Q &= \text{CF}_{\text{windowwest}} \times A_{\text{windowwest}} \\ &= 232,79 \text{ W/m}^2 \times 14,40 \text{ m}^2 = 3352,17 \text{ W} \end{aligned}$$

Answer:

The cooling value for the fixed window of 14,40m², on the west is 3352,17W

Cooling case B (fixed 3,60 m² on the south)

$$U_{\text{windowssouth}} = 2,84 \text{ W/m}^2 \cdot \text{K}$$

$$\begin{aligned} \text{HF} &= U_{\text{windowssouth}} \times \Delta T_{\text{cooling}} \\ &= 2,84 \text{ W/m}^2 \times 7,9^{\circ}\text{C} \\ &= 22,43 \text{ W/m}^2 \end{aligned}$$

$$\begin{aligned} Q_{\text{windowssouth}} &= \text{HF}_{\text{windowssouth}} \times A_{\text{windowssouth}} \\ &= 22,43 \text{ W/m}^2 \times 3,60 \text{ m}^2 \\ &= 80,74 \text{ W} \end{aligned}$$

$$\begin{aligned} \text{CF}_{\text{windowssouth}} &= (U_{\text{windowssouth}} \times (\Delta T - (0,46\text{DR}))) + (\text{PXi} \times \text{SHGC} \times \text{IAC} \times \text{FFs}) \\ &= 2,84 \text{ W/m}^2 \cdot \text{C} \times (7,9^{\circ}\text{C} - 0,46 \times 11,90^{\circ}\text{C}) \\ &= 2,84 \text{ W/m}^2 \cdot \text{C} \times (7,9^{\circ}\text{C} - 5,47^{\circ}\text{C}) \\ &= 2,84 \text{ W/m}^2 \cdot \text{C} \times 2,43^{\circ}\text{C} \\ &= 6,90 \text{ W/m}^2 \end{aligned}$$

$$\begin{aligned} (\text{PXi} \times \text{SHGC} \times \text{IAC} \times \text{FFs}) &= \\ &= 557 \times 0,46 \times 1 \times 0,47 = \\ &= 120,20 \text{ W/m}^2 \end{aligned}$$

$$\begin{aligned} \text{Total CF} &= 6,90 \text{ W/m}^2 + 120,20 \text{ W/m}^2 = \\ &= 127,10 \text{ W/m}^2 \end{aligned}$$

$$\begin{aligned} \text{TOTAL } Q &= \text{CF}_{\text{windowssouth}} \times A_{\text{windowssouth}} \\ &= 127,10 \text{ W/m}^2 \times 3,60 \text{ m}^2 = 457,56 \text{ W} \end{aligned}$$

Answer:

The cooling value for the fixed window of 3,60m², on the south is 457,56W

Heating case C (operable 3,60 m² on the south)

$$U_{\text{windowssouth}} = 2,84 \text{ W/m}^2 \cdot \text{K}$$

$$HF = U_{\text{windowssouth}} \times \Delta T_{\text{cooling}}$$

$$2,84 \text{ W/m}^2 \times 7,9^\circ\text{C}$$

$$22,43 \text{ W/m}^2$$

$$Q_{\text{windowssouth}} = HF_{\text{windowssouth}} \times A_{\text{windowssouth}}$$

$$22,43 \text{ W/m}^2 \times 3,60 \text{ m}^2$$

$$80,74 \text{ W}$$

$$CF_{\text{windowssouth}} = (U_{\text{windowssouth}} \times (\Delta T - (0,46DR))) + (PXI \times SHGC \times IAC \times FFs)$$

$$2,84 \text{ W/m}^2 \cdot \text{C} \times (7,9^\circ\text{C} - 0,46 \times 11,90^\circ\text{C})$$

$$2,84 \text{ W/m}^2 \cdot \text{C} \times (7,9^\circ\text{C} - 5,47^\circ\text{C})$$

$$2,84 \text{ W/m}^2 \cdot \text{C} \times 2,43^\circ\text{C}$$

$$6,90 \text{ W/m}^2$$

$$(PXI \times SHGC \times IAC \times FFs) =$$

$$556 \times 0,54 \times 1 \times 0,47 =$$

$$141,11 \text{ W/m}^2$$

$$\text{Total CF} = 6,90 \text{ W/m}^2 + 141,11 \text{ W/m}^2 =$$

$$148,01 \text{ W/m}^2$$

$$\text{TOTAL Q} = CF_{\text{windowssouth}} \times A_{\text{windowssouth}}$$

$$148,1 \text{ W/m}^2 \times 3,60 \text{ m}^2 = 532,84 \text{ W}$$

Answer:

The cooling value for the fixed window of 3,60m², on the south is 532,84 W
